Can the training of engineers help millions of people who struggle daily to stay alive?

Bernard Amadei, a civil engineering professor at the University of Colorado at Boulder, thinks so. He founded Engineers Without Borders-USA (EWB-USA) in June 2002 with the goal of connecting engineers and engineering students with developing communities. Together, they design and implement sustainable projects that bring clean drinking water, renewable energy, accessible public health programs, and sustainable agriculture to these communities. With more than 11,000 volunteers, EWB-USA has helped nearly a million people in 43 countries improve their quality of life.

America's colleges and universities teach the people who solve the problems and change the world.
